Introduction

For over 25 years our Paragon Scientific site has specialised in and continues to produce a comprehensive range of certified reference materials (CRMs) and standards. Paragon holds dual UKAS accreditations ISO 17025 & ISO 17034, ensuring the highest level of product quality, metrology and traceability. We offer one of the broadest ranges of viscosity CRMs in the industry, as well as a wide range of other physical property standards. Our customers include some of the largest petrochemical and fuel

testing laboratories in the world, but our products are also used by many food, environmental, cannabis and pharmaceutical testing laboratories.

With nearly 50 years of experience the LGC Industrials portfolio is comprised of industry leading brands including VHG, ARMI, MBH and Paragon Scientific. Building on our collective expertise, Industrial fosters the innovation and the agility necessary to create the measurement tools you rely on when developing, using, and transforming materials to achieve your mission.

Viscosity Reference Standards

Viscosity

LGC Industrial's produce dual accredited ISO 17025 / ISO 17034 viscosity standards for the calibration and verification of all types of viscometers, where operating temperature is controlled precisely. All viscosity standards are manufactured from high quality raw materials.

General Purpose Viscosity Reference Standards

General Purpose Viscosity Standards are certified at all temperatures in strict accordance with the primary method for the certification of oil-based viscosity standards ASTM D2162 and ASTM D1480. Data quoted on certificate for Kinematic Viscosity, Dynamic Viscosity and Density at a range of temperatures between 20 and 100 °C

All General Purpose standards are applicable for use with ASTM D445, ASTM D446, IP 71 Section 1, IP 71 Section 2, ISO 3104, ISO 3105, and other internationally equivalent methodology.

Cold Crank Simulator (CCS) Viscosity Reference Standards

Cold Crank Simulator (CCS) Viscosity Standards are for the calibration and verification of analytical equipment used in (CCS) oil testing to ASTM D5293, "SAE Specification J300" and other internationally equivalent methodology. Dynamic viscosity (mPa·s) and kinematic viscosity mm²/s (cSt) data is quoted on the certificate.

Can also be used for other low temperature applications.

Low Temperature Viscosity Reference Standards

Low Temperature Viscosity Standards are widely used for the calibration and verification of viscometers used at sub-zero temperature. Low Temperature Viscosity Standards are applicable for use with ASTM D445, D2983, D3829, D4684, and other internationally equivalent methodology.

High Temperature Viscosity Reference Standards

High Temperature Viscosity Standards offer additional certified data to the General Purpose Viscosity Standards, up to a temperature of 150 °C. All High Temperature Viscosity Standards are applicable for use with ASTM D445, ASTM D446, IP 71 Section 1, IP 71 Section 2, ISO 3104, ISO 3105, and other internationally equivalent methodology.

Small Sample Viscosity Reference Standards

The Small Sample Viscosity Standards offer a cost-effective 60ml volume, reducing potential waste for the low volume viscometer user. Standards are certified for kinematic viscosity mm²/s (cSt) at 40 and 100 °C, in strict accordance with ASTM D2162.

Rotational Viscosity Reference Standards

We offer a wide range of Rotational Viscosity Standards in two matrices; Mineral Oil and Silicon Fluid. These are applicable across a wide range of industries.

Section 1: Viscosity Reference Standards

Silicone Rotational Viscosity Reference Standards

Silicone Rotational Viscosity Standards are specifically formulated for calibration and verification of rotational viscometers. They are certified at 20 and 25 °C, for Kinematic Viscosity mm²/s (cSt), Dynamic Viscosity (mPa·s) and Density (g/mL).

Mineral Oil Rotational Viscosity Reference Standards

Mineral Oil Rotational Viscosity Standards are the first choice option where end users are unable to have silicone in their process. They are certified for dynamic viscosity from 20 °C through to 25 °C at 0.5 °C intervals. The dynamic viscosities at 20 and 25 °C were derived from the kinematic viscosities certified in strict accordance with ASTM D2162 and the densities certified in strict accordance with ASTM D1480. Dynamic viscosities at intermediate temperatures were derived from the kinematic viscosities calculated using ASTM D341 and densities calculated by proportional calculations.

Flow Cup Viscosity Reference Standards

Flow Cup Viscosity Standards are designed for use with most flow cup viscometers. Certified at 20 and 25 °C for Kinematic Viscosity mm²/s (cSt), Dynamic Viscosity (mPa·s) and Density (g/mL), they are also supplied with calculated drain times, for the Ford, ISO, Shell, and Zahn flow cups, derived from the kinematic viscosity and calculations as defined in the methodology. A table of flow cups and calculations is also included on the reverse of the certificate. Applicable methods include, but are not limited to, ASTM D1200, D4212, ISO 2431 and other internationally equivalent methodology.

Cone and Plate Viscosity Reference Standards

Our Cone and Plate Viscosity Standards are specifically formulated for viscometers used in the paints and coatings industry. Certified at 20 and 25 °C, quoting Kinematic Viscosity mm²/s (cSt), Dynamic Viscosity (mPa·s) and Density (g/mL). Where applicable, Krebs Units (KU) will also be quoted.

Water Viscosity Reference Standards

Our Pure Water Viscosity Standard is certified for Kinematic Viscosity mm²/s (cSt), Dynamic Viscosity (mPa·s) and Density (g/mL), at 5, 20, 25 and 37 °C. Certification is carried out in strict accordance with ASTM D445 at 5 °C and ASTM D2162 at 20, 25 & 37 °C. Density determination is carried out at all temperatures, in strict accordance with "ASTM D1480.

Medical Viscosity Reference Standards

We produce medical grade viscosity standards which are water / glycerine based. Certified for Kinematic Viscosity mm²/s (cSt), Dynamic Viscosity (mPa·s) and Density (g/mL), at 25 and 37 °C in strict accordance with ASTM D2162 and ASTM D1480.

Custom Blend Viscosity Reference Standards

If a customer has a requirement for a different temperature or viscosity value other than those quoted, please contact the Paragon technical department for further information. At Paragon Scientific we take pride in making customer needs our priority and we have a long history of supplying custom blends to many satisfied end-users.

Base Number Reference Standards

LGC Industrial's ISO 17025 & ISO 17034 total Base Number (TBN) Standards are specifically manufactured for the verification of analytical instruments used to determine base number by potentiometric titration. TBN standards are certified in accordance with ASTM D2896 / IP 276 and are applicable for use with other internationally equivalent methods.

The TBN value is important in the lubricants industry. Like the TAN Value, it is used as a confirmatory in the quality control of new and used lubricants, such as condition monitoring during lubricant use. TBN is derived from additives such as detergents and is an indicator of the lubricants ability to neutralise acids that can be formed during operation.

Acid Number Reference Standards

LGC Industrial's ISO 17025 & ISO 17034 Total Acid Number (TAN) Standards manufactured for the verification of analytical instruments used to determine acid number by potentiometric titration. TAN Standards are certified in accordance with ASTM D664 / IP 177 and are applicable for use with internationally equivalent methods.

The TAN value is important in the lubricants industry as a confirmatory test in the quality control testing of new lubricants and is also used for condition monitoring of in use / used lubricants. The total acid number will be an indicator for the age of a lubricant and assist on the timing of oil changes.

Section 4

Sucrose Brix Reference Standards

Paragon's dual accredited ISO 17025 / ISO 17034 Sucrose Standards are for use in the calibration and verification of all types of refractometers e.g. handheld, Abbe and high accuracy digital instruments. Sucrose Brix Standards do not contain stabilisers and are manufactured from high purity materials in accordance with International Commission for Uniform Methods of Sugar Analysis (ICUMSA) methodology.

Smoke Point Reference Standards

Paragon's dual accredited ISO 17025 & 17034 Smoke Point Reference Fuel Blends are ideal for the calibration and/ or verification of analytical instrumentation for automatic or manual measurement of smoke point using ASTM D1322 and IP 598. The range of Smoke Point Reference Fuel Blends corresponds to listed composition values as per Table 1 in ASTM D1322 and IP 598. We also offer a set kit for use with automatic apparatus, which includes x1 of each reference blend. Applications – Kerosene and aviation turbine fuel.

Relative Density Reference Standards

Paragon's dual accredited ISO 17025 / ISO 17034 Relative Density (Specific Gravity) standards are designed for the calibration or verification of instruments, used to measure density and relative density of materials at the desired test temperature within the range of 15 °C to 25 °C. These include, but are not limited to, automatic instruments and hydrometers. All density measurements are made in accordance with ASTM D1480, for density and relative density (specific gravity) of viscous materials by Bingham Pycnometer. The Relative density was calculated by dividing the density, as obtained from ASTM D1480, by the density of water at the reference temperature.

Flash Point Reference Standards

Flash Point Primary Certified Reference Materials

Manufactured and certified by a method specific inter-laboratory study in strict accordance with ISO 17034, using only those laboratories accredited to ISO 17025 for the test. Intended for use in the verification of flash point apparatus on at least an annual basis, as required by flash point methodology. Please see Section 12 Single Parameter Certified Reference Materials (CRMs and CRMUs) for these certified reference materials.

Secondary Working Flash Point Reference Standards

Manufactured and certified in strict accordance with our ISO 17025 and ISO 17034 accreditations to ASTM D92 and ASTM D93, Procedure A. Intended for the regular verification of flash point apparatus.

Certified Ethanol Reference Standards

Dual accredited ISO 17025 & 17034 Certified Ethanol Standards are certified for % ABV (Alcohol by Volume) and are designed to be used for the calibration and/ or verification of alcoholmeters or densitometers used to determine alcohol content. The alcohol content is certified in accordance with the UK Revenue & Customs Laboratory Alcohol Table.

Applications – Food, Beverage and alcohol.

Density Reference Standards

Our dual accredited ISO 17025 & 17034 Density standards are available in temperature ranges between 15 – 150 °C, where the material is fluid at the desired test temperature, certified by ASTM D1480. Typically used in, but not limited to, density measuring equipment e.g., the oscillating u-tube method, such as ASTM D4052 / IP 365 and other internationally equivalent methodology.

Included in the density offering is a pure water density standard. Certified by ASTM D1480 at the temperatures of 15, 20 & 25 °C.

Section 12

Single Parameter Certified Reference Materials (CRMs and CRMUs)

We produce a variety of Single Parameter Certified Reference Materials, particularly aimed at the petroleum industry. Those materials produced under our ISO 17034 accreditation (denoted CRMU) are certified by a method specific inter-laboratory study using those laboratories that are accredited to ISO 17025 for the test. The materials certified outside our accreditation (denoted CRM) are certified by inter-laboratory study.

Primary Certified Flash Point standards

Certified by a method specific inter-laboratory study using test laboratories that are accredited to ISO 17025. Certified in strict accordance with our ISO 17025 and ISO 17034 accreditations to ASTM D92 and ASTM D93, Procedure A.

Conductivity Reference Standards

Here's our range of ISO 17025 & ISO 17034 accredited Conductivity Standards for calibration and verification of various conductivity meters. Conductivity is a physical analysis measuring the capability of a liquid to pass current ($\mu\text{S}/\text{cm}$). Our conductivity standards range from 2 to 500,000 $\mu\text{S}/\text{cm}$. Measurement is done by an in-house method based on ASTM D1125, Standard Test Methods for Electrical Conductivity and Resistivity of Water, however usage is applicable to most conductivity applications.

Colour Reference Standards

A wide range of colour standards for the calibration and verification of colour measuring instruments. The current range includes materials accredited under ISO 17025 / ISO 17034, as well as materials certified under the ISO 9001 quality system.

Those supplied under ISO 17025 / ISO 17034 include ASTM Colour Standards (ASTM D1500, ASTM D6045), Gardner Colour Standards (ASTM D1544, ASTM D166) and Saybolt Colour Standards (ASTM D156, ASTM D6045).

Simulated Distillation Reference Standards

Our Simulated Distillation standards for use with ASTM D3552 and D7169. These are standard test methods for boiling point distribution of petroleum samples by gas chromatography. Our Simulated distillation standards must pass rigorous quality control in our ISO/IEC 17025-certified laboratory.

Red Eye in Diesel Reference Standards

ASTM D6258 Red Dye #26 Standards for determination of Solvent Red 164 Dye Concentration in Diesel Fuels to ensure your diesel fuel dye testing accuracy. Many commercially available reagents specified in ASTM D6258 have a significant problem with impurities. This can cause testing labs and final data end users unintended issues, up to and including serious penalties if their diesel fuel is found out of compliance. Our VHG is proud to solve these challenges with our accurate and thoroughly characterized dye testing standard for use with ASTM D6258. The calibration and control standards are produced from a highly characterized, certified dye, delivering consistent lot-to-lot performance for each calibration standard with excellent correlation statistics. The product is created using our stringent manufacturing processes, which are accredited to ISO 17034 and certified to ISO 9001 and was prepared to the certified concentrations shown on the reverse side by gravimetric methods in accordance to ASTM D6258. Each lot of the product passes rigorous Quality Control by UV-VIS in our laboratory accredited to ISO/IEC 17025.

Soot in Diesel Reference Standards

Performing regular diesel soot check scan help you save time and money by limiting waste from unnecessary oil changes, while protecting and extending the life of your diesel engines. LGC Industrial provides standards you can rely on for use in accordance with ASTM Methods D5967, D7686, and D7844. Our Soot Content Standards help streamline your lab operations by eliminating in-house soot standard preparation while strengthening the integrity of your testing results. We prepare these standards to the certified concentrations shown by Thermal Gravimetric Analysis (TGA) according to ASTM D5967, Appendix A4. Each lot of the product passes rigorous Quality Control by TGA. Each product is shipped with a comprehensive Certificate of Analysis (CoA). We ensures the accuracy of this standard for 24 months from the certification date.

Moisture Content Reference Standards

Our Moisture Content Standards are intended for use as a certified reference material in the determination of water in motor oil by Karl Fischer Crackle Test or Karl Fischer Titration.

Crackle Test Reference Standards

These standards are intended for use in the detection of water in motor oil by crackle test. It must be well shaken prior to use. This standard is NOT intended for use with Karl Fischer titration methods. Our standards are manufactured and certified under a quality control system that is accredited to both ISO 9001 and ISO/IEC 17025. This standard was prepared to the nominal concentration using gravimetric methods. Tools: The balances used in the preparation of VHG standards are calibrated regularly with traceability to NIST.

Titration Reference Standards

Our Karl Fischer titration standards are intended for use in accordance with ASTM Method D6304. These CRMs were manufactured and certified under a quality management system that is accredited to ISO 9001, ISO 17034 and ISO/IEC 17025. This CRM was prepared to the nominal water concentration of 0.5% (w/w) using gravimetric methods. The balances used in the preparation of our CRMs are calibrated regularly with traceability to NIST. The certified concentration was determined by using coulometric Karl Fischer titration, in accordance with ASTM D6304 Procedure C, and employing a water evaporator accessory.

Particle Count Reference Standards

Parti-Count Particle Count Standards for predictive engine failure analysis. Analysis of particles in fluids may be the most important way to monitor the condition of your engines. Once wear begins, the rate of wear usually increases rapidly, and studying trends in your particle count data can yield surprising dividends. VHG Parti-Count Particle Count Standards, compliant with ISO 11171 and traceable to NIST SRM 2806b, are cost-effective calibration standards for the verification of automatic particle counters. Parti-Count is created using our stringent manufacturing processes, which are accredited to ISO 17034 and certified to ISO 9001. This solution contains ISO Medium Test Dust (MTD) sourced directly from NIST RM 8631a for use with Automatic Particle Counters (APC) calibrated to ISO 11171. Each lot of Parti-Count passes rigorous Quality Control by Automatic Particle Counter (APC) in our laboratory accredited to ISO/IEC 17025.
